

→ Discrete Maths deals with the objects which have distinct values and can be counted.

→ List of topics : sets, function & relation

→ 1) Fundamentals of graph & tree

→ 2) Boolean algebra

→ 3) Mathematical modeling

→ 4) Security and Encryption

→ 5) Algorithm Analysis

→ 6) Proof techniques

1. Set & Proposition

→ Proposition - Any statement that can hold true or false is called proposition.

→ set is a collection of distinct discrete objects

→ Membership of the set is denoted by ∈

→ This is denoted by ∈ to differentiate

$$\text{ex } R = \{1, 2, 3\}$$

→ If 1 ∈ R, 2 ∈ R, 7 ∉ R

$$R = \{1, 2, 3\}$$

$$2 \notin R, \{2, 3\} \in R$$

→ Proper Subset : P is a subset of Q if every element of P is also element of Q .

ex. $P \subset Q$

→ Proper subset : P is proper subset of Q if P is subset of Q and $P \neq Q$.

ex. $P = \{1, 2\}$, $Q = \{1, 2, 3\}$

Here, $P \subset Q$ and $Q \neq P$.

→ Set Properties :

- for any set P , P is subset of P . (set is subset of itself).

- The empty set \emptyset is subset of any set. However, it may not be element of every set.

ex $A = \{1, 2, 3\}$

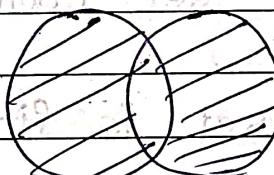

$\emptyset \subset A$ but $\emptyset \notin A$

→ No. of elements in a set is called Cardinality of the set and it is denoted by ' $|A|$ '.

ex $\{\{1\}\} \rightarrow$ cardinality is 1. because it contains 1 element.

Set Operations: Union, Intersection, Difference

- ① Union - Finding (all elements) of two sets.
 - ② Intersection - Finding common elements betⁿ two sets.
 - ③ Difference - $(A - B)$ is set of all elements of set A which are not in B.
 - ④ Symmetric difference - $((A \oplus B))$ it includes all elements of A & B but common elements should be skipped.

Properties related to sets cardinality

$$\textcircled{1} \quad |P \cup Q| \leq |P| + |Q|$$

$$② |P \cap Q| \leq \min(|P|, |Q|)$$

$$\textcircled{3} \quad |P \oplus Q| = |P| + |Q| - 2|P \cap Q|$$

$$(4) \quad |(p \wedge q)| \geq |p| - |q| \Rightarrow \text{right} \quad (n=2)$$

→ Principle of Inclusion and Exclusion:

$$|P \cup Q| = |P| + |Q| - |P \cap Q|$$

$$|P \cup Q \cup R| = |P| + |Q| + |R| - |P \cap Q| - |Q \cap R| - |P \cap R| + |P \cap Q \cap R|$$

→ One to One correspondence:

One to one correspondence betⁿ two sets exists if all elements of first set can be uniquely paired with all elements of second set.

→ Cardinality of a set can be finite or infinite

a set

- finite set : A set is finite if its elements have one to one correspondence with some other set whose cardinality is $k \in \mathbb{N}$

ex: $\{1, 2, 3, 4\}$ and $\{10, 20, 30, 40\}$

$$1 \rightarrow 10, 2 \rightarrow 20, 3 \rightarrow 30, 4 \rightarrow 40.$$

- Infinite set : It can be countable or uncountable.

- Countable infinite - If set has one to one correspondance betⁿ its elements and elements of \mathbb{N} . then it is called countable infinite.

eg. $X = \{3, 6, 9, 12, \dots\}$

$$N = \{1, 2, 3, \dots\}$$

eg. Find the no. of integers which are divisible by any number 2, 3, 5 or 7 in the range 1 to 250.

$$\rightarrow \text{No. of integers that are divisible by } 2 = \left\lfloor \frac{250}{2} \right\rfloor = 125$$

$$\text{No. of integers that are divisible by } 3 = \left\lfloor \frac{250}{3} \right\rfloor = 83$$

$$4 = \left\lfloor \frac{250}{4} \right\rfloor = 62$$

$$7 = \left\lfloor \frac{250}{7} \right\rfloor = 35$$

$$\text{Intersection } 283 \Rightarrow \left\lfloor \frac{250}{6} \right\rfloor = 41$$

$$\text{main } 385 \Rightarrow \left\lfloor \frac{250}{15} \right\rfloor = 16, \text{ main } 587 \Rightarrow \left\lfloor \frac{250}{35} \right\rfloor = 7$$

$$285 = \left\lfloor \frac{250}{10} \right\rfloor = 25, 287 = \left\lfloor \frac{250}{14} \right\rfloor = 17$$

$$387 = \left\lfloor \frac{250}{21} \right\rfloor = 11, 587 = 1, 11 =$$

$$28385 = 8, 38587 = 2, 28587 = 3$$

$$28387 = 5, 2838587 = 1, 23 =$$

$$|2 \cup 3 \cup 5 \cup 7| = 125 + 83 + 50 + 35 - 41 - 16 - 7 - 25 - 17 - 11 + 8 + 2 + 3 + 5 + 1$$

$$= 159 \boxed{159}$$

$$|A_1 \cup A_2 \cup A_3 \cup A_4| = |A_1| + |A_2| + |A_3| + |A_4| - |A_1 \cap A_2| - |A_2 \cap A_3| - |A_3 \cap A_4| - |A_1 \cap A_3| - |A_1 \cap A_4| - |A_2 \cap A_4| + |A_1 \cap A_2 \cap A_3| + |A_1 \cap A_3 \cap A_4| + |A_1 \cap A_2 \cap A_4| + |A_2 \cap A_3 \cap A_4| - |A_1 \cap A_2 \cap A_3 \cap A_4|$$

Eg. 100 out of 120 students study at least one of the languages. 65 students study French, 45 - German, 42 → Russian, 20 → French + German, 25 → French + Russian, 15 → German + Russian

(i) Find students studying only two languages but not third one

(ii) Find students who studies only one lang.

(iii) Find stu. who studies all lang.

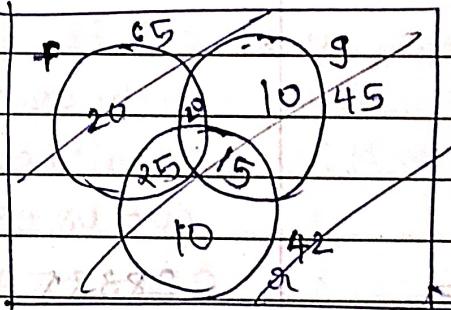

$$|A_1| = 65, |A_2| = 45, |A_3| = 42$$

$$|A_1 \cap A_2| = 20, |A_1 \cap A_3| = 25, |A_2 \cap A_3| = 15, |A_1 \cup A_2 \cup A_3| = 100$$

(i) French + German not Russian

$$|A_1 \cap A_2| - |A_1 \cap A_2 \cap A_3|$$

$$= 20 - 8 = 12$$

(ii) Only French

$$= |A_1| - |A_1 \cap A_2| - |A_1 \cap A_3|$$

$$= 65 - 20 - 25 + 8 = 28$$

(iii) $|A_1 \cap A_2 \cap A_3| = ?$

$$|A_1 \cup A_2 \cup A_3| = |A_1| + |A_2| + |A_3| - |A_1 \cap A_2| - |A_2 \cap A_3| - |A_1 \cap A_3| + |A_1 \cap A_2 \cap A_3|$$

$$100 = 65 + 45 + 42 - 20 - 25 - 15 + |A_1 \cap A_2 \cap A_3|$$

$$|A_1 \cap A_2 \cap A_3| = 18$$

$$100 = |A_1| + |A_2| + |A_3| - |A_1 \cap A_2| - |A_2 \cap A_3| - |A_1 \cap A_3| + |A_1 \cap A_2 \cap A_3|$$

$$100 = |A_1| + |A_2| + |A_3| - |A_1 \cap A_2| - |A_2 \cap A_3| - |A_1 \cap A_3| + |A_1 \cap A_2 \cap A_3|$$

Uncountable infinite \rightarrow there is no correspondence between its elements.

→ Diagonal Argument (Cantor's diagonal arg)

	Red	Black	Yellow	Green
A	Yes	No	No	Yes
B	No	No	Yes	
C	Yes	Yes	Yes	
New \rightarrow D	No	Yes	No	

The diagonal argument states that a certain object is not one of the given objects using a fact that it is different from each of the given objects in at least one way.

→ Proof for all real nos. b/w 0 & 1 are uncountable infinite set.

Let's assume a set of all nos. betⁿ 0 & 1 is countable infinite.

so there should be one to one correspondence betⁿ its elements. and N.

- Suppose the list of all no.s is betⁿ 0 & 1 as above.
- Let's assume one no. a_1, a_2, \dots, a_n such that x_1 is different than a_1, x_2 is different than a_2 and so on.
- So, this new no. is different than all existing no. in given list. so the list is incomplete and there is no one to one correspondence with \mathbb{N} set of Natural no. N.

So, our assumption is incorrect.

Hence the set of real no. betⁿ 0 & 1 is uncountable infinite

\Rightarrow Principle of Mathematical Induction : (P.M.I)

For a given statement which involves natural no. n if we can show that,

(1) Statement is true for $n = n_0$ (Basic)

(Hypothesis)

(2) Assume that the statement is true for $n = k$ and prove that a statement is true for $n = k+1$. (Induction step)

(3) Then the statement is true for all natural no. n

$\geq n_0$

Eg. Given the coins of value 3 & 5. Prove that any amount of 8 or more can be formed using the available coins.

$$8 = 3+5 \rightarrow \text{case-I}$$

$$9 = 3+3+3$$

$$10 = 5+5 \rightarrow \text{case-II}$$

$$11 = 3+3+5 \rightarrow \text{case-III}$$

$$12 = 3+3+3+3$$

(1) Basis of Induction

- Let Base amount is 8 and since $8 = 5+3$, so basis is proved.

(2) Induction Hypothesis

- It is possible to make any amount k using coins of 3 & 5.

- Case-I If amount k is made using 3 & 5, then we can replace 5 with two 3's to get $k+1$ amount.

- Case-II If amount k is made using only 3's then we can replace 3's with 5's to get $k+1$ amount.

- Case-III If amount k is made using only 5's then we can replace 5 with two 3's to get $k+1$ amount.

So, according to above cases if hypothesis P_5 true, then we can make amount $n+1$ using the coins of 3 & 5.

So, the statement is proved for all the numbers.

eg. Prove that $1^2 + 2^2 + \dots + n^2 = \frac{n(n+1)(2n+1)}{6}$; ($n \geq 1$)

→ Basis

$$\text{L.H.S.} = 1^2 = 1 \quad (n=1)$$

$$\text{R.H.S.} = \frac{1(1+1)(2+1)}{6} = \frac{1}{6} \times 6 = 1$$

So, Basis is proved.

- Hypothesis:

Assume $1^2 + 2^2 + \dots + k^2 = \frac{k(k+1)(2k+1)}{6}$

the hypothesis

Now we need to prove that

$$1^2 + 2^2 + \dots + (k+1)^2 = \frac{(k+1)(k+2)(2(k+1)+1)}{6}$$

Now, from above following if

$$\begin{aligned} \text{L.H.S.} &= 1^2 + 2^2 + \dots + (k+1)^2 \\ &= 1^2 + 2^2 + \dots + k^2 + (k+1)^2 \\ &= k(k+1)(2k+1) + (k+1)^2 \end{aligned}$$

(\because From Hypothesis)

$$= \frac{k(k+1)[(2k+1)k + 6(k+1)]}{6} \quad \text{... (1)}$$

$$= (k+1) \left[\frac{2k^2 + 7k + 6}{6} \right]$$

$$= (k+1)(2k+3)(k+2)$$

$$= (k+1)(k+2)(2(k+1)+1)$$

$$= \text{R.H.S.} \quad \boxed{(k+1)(k+2)(2k+3)}$$

So, the statement is true for $n = k+1$.

Hence the statement is true for all $n \geq 1$.

Eg. Prove that $\frac{1}{1 \cdot 2} + \frac{1}{2 \cdot 3} + \frac{1}{3 \cdot 4} + \dots + \frac{1}{n(n+1)} = \frac{n}{n+1}$

for $n \geq 1$.

\rightarrow Basis: LHS = $\frac{1}{1 \cdot 2} = \frac{1}{2}$

RHS = $\frac{1}{1} = \frac{1}{2}$

So, Basis is proved.

\rightarrow Hypothesis: Assume the hypothesis

$$\frac{1}{1 \cdot 2} + \frac{1}{2 \cdot 3} + \dots + \frac{1}{k(k+1)} = \frac{k}{k+1}$$

We need to prove that

$$\frac{1}{1 \cdot 2} + \frac{1}{2 \cdot 3} + \dots + \frac{1}{k(k+1)} + \frac{1}{(k+1)(k+2)} = \frac{k+1}{k+2}$$

Now, L.H.S = $(k+1)^3 + 2(k+1)$

$$= \frac{1}{1 \cdot 2} + \frac{1}{2 \cdot 3} + \dots + \frac{1}{(k+1)(k+2)}$$

$$= \frac{1}{1 \cdot 2} + \frac{1}{2 \cdot 3} + \dots + \frac{1}{k(k+1)} + \frac{1}{(k+1)(k+2)}$$

$$= \frac{k}{k+1} + \frac{1}{(k+1)(k+2)} \quad (\because \text{From Hypothesis})$$

$$= \frac{1}{(k+1)} \left[k(k+2) + 1 \right]$$

$$= \frac{(k^2+2k+1)}{(k+1)(k+2)} = \frac{(k+1)^2}{(k+1)(k+2)}$$

$$= \frac{(k+1)}{k+2} = \text{RHS}$$

∴ Statement is true for $n=k+1$

Hence, the statement is true for all $n \geq 1$.

e.g.

Show that for $n \geq 1$, $n^3 + 2n$ is divisible by 3.

Basis: $n=1$

$1^3 + 2 \cdot 1 = 3$ is divisible by 3.

Hypothesis: For $n=k$. Assume that

$k^3 + 2k$ is divisible by 3.

need to prove that $(k+1)^3 + 2(k+1)$ is divisible

by 3.

$(k+1)^3 + 2(k+1) = k^3 + 3k^2 + 3k + 1 + 2k + 2$

$$\begin{aligned}
 & (k+1)^3 + 2(k+1) \\
 &= k^3 + 1 + 3k^2 + 3k + 2k + 2 \\
 &= k^3 + 2k + 3k^2 + 3k + 3 \\
 &= 3(k^2 + k + 1) + k^3 + 2k + 1 \quad (\text{from hypothesis}) \\
 &\quad k^3 + 2k \text{ is divisible by 3}
 \end{aligned}$$

$= 3m + k^3 + 2k$
 since $k^3 + 2k$ is divisible by 3 as per
 hypothesis and the other quantity is also
 divisible by 3. So the induction is proved.

eg prove that $n^4 - 4n^2$ is divisible by 3. for $n \geq 2$.

Basis for $n=2$

$$\text{LHS } 16 - 16 = 0 \text{ is divisible by 3.}$$

Hypothesis for $n=k$ Assume that $k^4 - 4k^2$
 is divisible by 3.

need to prove that $(k+1)^4 - 4(k+1)^2$ is divisible

$$\begin{aligned}
 & (k+1)^4 - 4(k+1)^2 \\
 &= (k+1)^2 [(k+1)^2 - 4]
 \end{aligned}$$

$$\begin{aligned}
 &= (k+1)^2 [k^2 + 2k - 3] \\
 &\leq (k+1)^2 (k+3)(k-1) \\
 &= (k^2 + k + 1)(k^2 + 2k - 3) \\
 &= k^4 + 2k^3 - 3k^2 + 2k^3 + 4k^2 - 6k + k^2 + 2k - 3 \\
 &= k^4 + 4k^3 - 4k^2 + 4k^2 + 2k^2 - 3 - 4k \\
 &= 4k^3 + 6k^2 - 3 + (k^4 - 4k^2) - 4k
 \end{aligned}$$

$$= 3 \left(\frac{4}{3}k^3 + 2k^2 \right) - 3 + (k^4 - 4k^2)$$

$$= \underline{(K^4 - 4K^2)} + (4K^3 - 4K) + \underline{(6K^2 - 3)}$$

$$= 4(k+1)k(k-1) + (k^4 - 4k^2) + (6k^2 - 3)$$

Second quantity is divisible by 3 as per hypothesis. first quantity is divisible by 3 because it is product of three consecutive numbers and third quantity is of form $3(m)$ that is also divisible by 3.

Hence the induction is proved.

eg. Show that, any integer composed of identical digits is divisible by 3.

Basislänge, in $n=1$ und $m=10^2 = 100$ m H

ex 111 is divisible by 3.

for $n=1$ all no.'s with identical 3 digits are
 divisible by 3. such 9 no.s are possible

Hypothesis

Any no. with 3^k identical digits is divisible by 3^k .
 prove that, if a no. contains 3^{k+1} identical digits then it is divisible by (3^{k+1}) .

lets assume a number with 3^{k+1} identical digits.

Now, assume that number is product of x and y .
where x is a number containing 3^k identical numbers

$$3^{k+1} = x \cdot y$$

(ex. $222222222 \Rightarrow x = 222$)

($y = 1001001$)

x is divisible by 3^k by hypothesis.

Because sum of digits in y is equal to $3 \cdot 8$.

y is divisible by 3. So assumed no. is also

divisible by 3^{k+1} .

Eq. Show that any integer n , $(11)^{n+2} + (12)^{2n+1}$ is divisible by 133.

Basis

$$n = 0$$

$$(11)^3 + 12^3 = 1331 + 1728$$

Hypothesis for any integer $n = k$

$(11)^{k+2} + (12)^{2k+1}$ is divisible by 133.

we need to prove that $(11)^{k+3} + (12)^{2(k+1)+1}$ is divisible by 133.

$$= (11)^{k+3} + (12)^{2(k+1)+1}$$

$$= (11)^{k+2} \cdot (11) + (12)^{2k+3}$$

$$= (11)^{k+2} \cdot (11) + (12)^{2k+1} \cdot (12)^2$$

$$= (11)^{k+2} \cdot (11) + (12)^{2k+1} (133 + 1)$$

$$= (11)(11)^{k+2} + (11)(12)^{2k+1} + (133)(12)^{2k+1}$$

$$\rightarrow (11) [11^{k+2} + 12^{2k+1}] + 133(12)^{2k+1}$$

$$= 11(133y) + 133(12x) \quad (= \text{From Hypothesis})$$

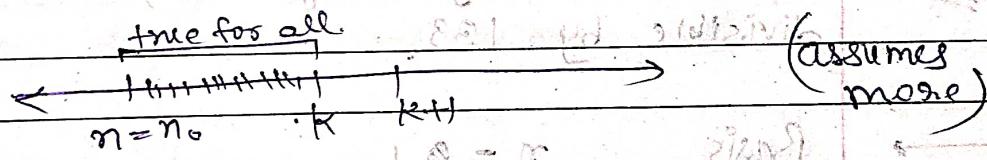

$$= 133(11y + x)$$

$\Rightarrow 133 \cdot m$ is divisible by 133.

Eg, \Rightarrow Strong Mathematical Induction.

- In strong Mathematical Indⁿ the hypothesis is assumed to be true for $n_0 \leq n \leq k$

Other details are same as normal Indⁿ.

Ex. Show that any positive integer $n \geq 2$ is either prime no. or product of two prime numbers.

Basis of Induction $n=2$

since 2 is prime number, basis is true.

Hypothesis (Strong induction)

The statement is true for any n such that $2 \leq n \leq k$.

Should be true (proved)

Induction Step

Assume a no. $k+1$
case-I $(k+1)$ is prime
 then the statement is true

case-II If $(k+1)$ is not prime, then it can be
 always expressed as product of two nos.

say p and q such that $[p, q \leq k]$

then $k+1 = p \cdot q$ $[p, q \leq k]$

so As per hypothesis p & q are either prime nos or
 product of prime nos. so the no. $k+1$ is also
 either prime or product of prime nos.

Ex. Show that $2^n > n^3$ for $n \geq 10$.

Basis $n=10$

Left hand side $LHS = 2^{10} = 1024 > 10^3 = RHS$.

Hypothesis

Statement is true for any k such that

$$n=k, 2^k > k^3$$

need to prove for $2^{k+1} > (k+1)^3$

Now, $2^k > k^3$

$2^{k+1} > 2k^3$
 if we prove $2k^3 > (k+1)^3$

$$\Rightarrow 2k^3 > k^3 + 3k^2 + 3k + 1$$

$$\Rightarrow k^3 > 3k^2 + 3k + 1$$

$$\Rightarrow 1 > \frac{3}{k} + \frac{3}{k^2} + \frac{1}{k^3} \quad (\because \text{divide by } k^3)$$

put $k=10$

$$1 > \frac{3}{10} + \frac{3}{10^2} + \frac{1}{10^3}$$

for $k=10$ statement is true, $1 > 0.333$.

so, for all values $k > 10$ the statement is true.

$$2k^3 > 2k^3 \quad (1) \text{ by definition}$$

$$2k^3 > (k+1)^3 \quad (2) \text{ using (1)}$$

By transitivity, $k+1 > (k+1)^3$ is also proved.

Proposition

- The use of proposition logic is to convert natural language into mathematical statement

- Proposition is a declarative sentence - either true or false.

- Some propositions are always true. A proposition which is always true. - Tautology.

- A proposition which is always false. - Contradiction

- Evaluation of proposition means assigning true or false value to the proposition.

Two propositions can be combined

- Two or more propositions can be combined using connectives.

Connectives: *and*, *but*, *so*, *because*, *although*, *since*, *since*

- | | | |
|-----|-------------|----------------|
| (1) | Dijunction | $(P \vee Q)$ |
| (2) | Conjunction | $(P \wedge Q)$ |

P	q	$\neg p \vee q$	$\neg p \wedge q$
T	T	T	F
T	F	T	F
F	T	T	F
F	F	F	F

- ### (3) Negation ($\sim p$)

$P \rightarrow T$	$T \rightarrow F$	$F \rightarrow P$
$P \rightarrow T$ $\neg P \rightarrow \neg T$	$T \rightarrow F$ $\neg T \rightarrow \neg F$	$F \rightarrow P$ $\neg F \rightarrow \neg P$
$P \rightarrow T$ $\neg P \rightarrow \neg T$	$T \rightarrow F$ $\neg T \rightarrow \neg F$	$F \rightarrow P$ $\neg F \rightarrow \neg P$

- (4) Exclusive-OR ($P \oplus Q$)

P	Q	$P \oplus Q$
T	T	F
T	F	T
F	T	T
F	F	F

→ A proposition which is obtained from the combination of the other propositions is called "Compound proposition".

→ A proposition which is not a combination is called "Atomic proposition".

P	q	$(p \wedge q) \vee \neg p$	proposition 1 (1)
T	T	(P \wedge q) \vee $\neg p$	proposition 2 (2)
T	F	F	
F	T	F \vee F \equiv F	
F	F	T \vee T \equiv T	

→ Compound proposition are of two types:

(i) Conditional. ($p \rightarrow q$)

(ii) Biconditional. ($p \leftrightarrow q$)

(i) conditional statement is defined as $p \rightarrow q$ (If p then q)

(ii) Biconditional statement is defined as $p \leftrightarrow q$
(p if and only if q) [$(p \rightarrow q) \wedge (q \rightarrow p)$]

→ Necessary & Sufficient Cond²:

p is necessary for q means if q is true p must be true but p is true that doesn't mean q is true.

ex. p = a person is 18 years old.

q = a person is president of india.

Sufficient Condition

if $p \rightarrow q$ is true then p is sufficient for q .

p is sufficient for q means that if p is true then we can always conclude that q is also true.

ex. If $p = \text{person has voter card}$, then

$q = \text{Person is 18 years old}$. Then we know if p is true then q is also true.

p can be both sufficient and necessary condⁿ for q . (if $p \rightarrow q$ and $q \rightarrow p$)

ex. $p = \text{person is born in some country}$.

$q = \text{person is citizen of that country}$.

p is sufficient condⁿ for q .

ex. $p = \text{no. is a multiple of 9}$ and $q = \text{no. is a multiple of 3}$.

$p \rightarrow q$ is true because if no. is a multiple of 9 then it is also a multiple of 3.

p is sufficient condⁿ for q .

ex. $p = \text{two lines are parallel} \rightarrow q$.

$q = \text{two lines are not intersecting}$.

p is sufficient & necessary for q ($p \leftrightarrow q$)

p	q	$p \rightarrow q$	$p \leftrightarrow q$ or (X-NOR)
-----	-----	-------------------	----------------------------------

T	F	T	F
---	---	---	---

F	T	T	F
---	---	---	---

so $p \leftrightarrow q$ is false if p and q are not equal.

so if $p \rightarrow q$ is true then p and q are not equal.

so if $p \rightarrow q$ is true then p and q are not equal.

Ex.

An island has two tribes of natives. Any native from the first tribe always tells the truth, while any native from the other tribe always lies. You arrive at the island and ask a native if there is gold on the island. He answers, "There is gold on the island if and only if I always tell the truth". Which tribe is he from? Is there gold on the island?

→ p = he always tells the truth

q = there is gold on the island.

Suppose, that his answer to \rightarrow he always tells the truth. That is, p is true.

Therefore, q must be true. That is, his answer to our question must be true.

∴ $p \leftrightarrow q$ is true

Suppose, he always lies, that is p is false.

Also, his answer to our question is a lie, which means that $p \leftrightarrow q$ is false.

Consequently, q must be true.

(F, T = F)

Thus, in both cases we can conclude that there is gold on the island, although the native could have been from either tribe.

Ex

$p = \text{the food is good}$

$q = \text{the service is good}$

$r = \text{the rating is 3 star}$

(1) Either the food is good or service is good or both. $\rightarrow p \vee q$

(2) Either the food is good or service is good but not both $\rightarrow p \oplus q$

(3) Food is good but the service is poor. $\rightarrow p \wedge \neg q$

(4) It is not the case that food is good and rating is 3 stars. $\rightarrow (\neg p \wedge \neg r)$

(5) If both food and service is good then rating is 3 stars. $\rightarrow (p \wedge q) \rightarrow r$

(6) It is not true that 3 star always means good food and good service.

For proposition $p \rightarrow q$, the proposition $q \rightarrow p$ is called converse.

The proposition $\neg q \rightarrow \neg p$ is called contrapositive.

The proposition $\neg p \rightarrow \neg q$ is called inverse.

Ques.

Find truth values of all above.

P	Q	$P \rightarrow Q$	$\neg Q \rightarrow \neg P$	$\neg P \rightarrow \neg Q$	$\neg \neg P \rightarrow \neg \neg Q$
T	T	T	T	T	T
T	F	F	T	F	F
F	T	T	F	F	T
F	F	F	T	T	T

$P \rightarrow Q$ & $\neg Q \rightarrow \neg P$ is same.

$\neg Q \rightarrow \neg P$ & $\neg P \rightarrow \neg Q$ is same.

Ex.

Give the converse, contrapositive and inverse of the full implication : "If it rains today, I will go to college tomorrow."

Converse : (If I will go to college tomorrow, then it would have rained today,

Contrapositive : If I do not go to college tomorrow, then it will not have rained today.

Inverse : If it does not rain today, then I will not go to college tomorrow.

3. Relation & Function

Relation:

→ In a set, the elements are sometimes related with each other, such elements have some common factor betⁿ them.

$$S = \{1, 2, 3, 4, 5, 6\}$$

$$R = \{(2, 4, 6), (1, 3, 5)\} \leftarrow \text{called relation.}$$

Define cartesian Product:

$$A = \{a, b\}, B = \{c, d\}$$

$$A \times B = \{(a, c), (a, d), (b, c), (b, d)\}$$

$$A \times A = \{(a, a), (a, b), (b, a), (b, b)\}$$

→ Binary relation from set A to B is subset of cartesian product $A \times B$.

$$A = \{1, 2\}, B = \{1, 3\}$$

$$A \times B = \{(1, 1), (1, 3), (2, 1), (2, 3)\}$$

If relation is defined as "less than" then,

$$R = \{(1, 3), (2, 3)\}$$

→ $a R b$ — a is related with b

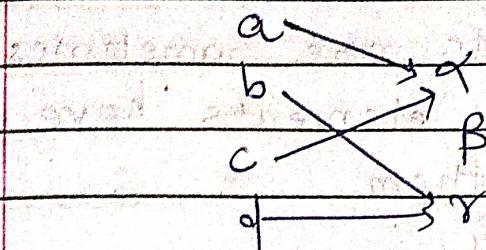

→ Relation is always ordered pair.

→ Tabular Form of Relation:

$$R = \{(a, \alpha), (c, \alpha), (b, \gamma), (c, \gamma)\}$$

	α	β	γ
a	✓		
b			✓
c		✓	
d			✓

Graphical form of Relation

→ Just like a set relation has foll¹ operations.

$R_1 \cup R_2$, $R_1 \cap R_2$, $R_1 - R_2$, $R_1 \oplus R_2$

→ Ternary relation can be defined as subset of Cartesian product of $(A \times B)$ and C

$$\text{eg. } R = \{((a, x), 1), ((a, x), 2) \dots \}$$
